�� This program is a simple application that lets you browse folders on your computer, and if it finds a folder with image files in it, it will display an attractive background image to your desktop. �� You can set it to just change the background image or also to also change the computer screen saver. �� It is a lightweight application, which means that it has a very small memory and CPU requirement. It also uses very little of your hard drive space. �� For each folder you want to use for the background image, you need to have it in the folder with a .PNG file extension. �� You can optionally use an internal or external hard drive to host your folders. �� It uses very little system resources, so it is not a resource hog, and it should not affect your system performance. �� It will change your desktop background image on the computer screen, so if you have a computer monitor that is not connected to a computer, you can still use this program. �� The background image you choose will be displayed on your computer screen, so if you have a lot of wall paper on your desktop, your computer wallpaper will be changed as well. �� You can download the SyncFolders Serial Key application for free for 15 days, and you can purchase it after the trial period for $4.99. �� Click here to see a video tutorial on how to install and use the program. �� Click here to read a user's manual for the program. �� The SyncFolders Product Key program supports .jpg,.bmp,.png, and.gif files. �� You can purchase other programs from my store, which are not listed on this page. �� There are two other programs that are free: the Quiet Screen Saver and the Universal Desk Calendar. �� Click here to see a video tutorial for the Quiet Screen Saver and here to see a video tutorial for the Universal Desk Calendar. �� Click here to see the five best Free programs for Free Download. �� Click here to visit the Free Update Center. �� Click here to read reviews of the program. �� Click here to read user's manual for the program. �� You can also

KEYMACRO is a very simple but very powerful tool that allows users to easily create macros (on the Windows platform). A macro allows users to automate various keyboard shortcuts (such as Ctrl + C, Ctrl + V, Ctrl + L). For example, users can create a macro with the name of a command (by pressing Alt + S), and they can assign it a keyboard shortcut (by right clicking on the command and clicking on the shortcut option) to create a copy, paste, cut, or select a file, to add it to a file, to create a folder, etc. The program comes with a simple interface that allows users to set a range of options for each macro that they create, such as: - The name and description of the command, which includes spaces; - The commands assigned to keyboard shortcuts; - The Alt and Shift key used with each shortcut; - The number of repetitions of the command; - The order of the commands (for example, before and after a command); - The hotkeys assigned to the commands. After creating a new macro, users can use the program to: - run all macros automatically; - run the macros consecutively (run one macro, press the key that activates another macro, etc.); - set a delay for running the macros; - stop running all macros (to enable other macros to be run); - modify or delete existing macros; - run macros only in a specific folder; - configure the hotkeys assigned to the macros; - create shortcuts for the macros. ... Microsoft is recalling roughly 350,000 PCs worldwide to repair a security issue that threatens to expose sensitive information stored on the hard drives of certain laptops. The company notified Microsoft Certified Partners on Oct. 31 that the problem is related to the Windows XP operating system, and that "a fix is available to remediate the issue for impacted systems," according to a statement from the company, which said the problem affects users of devices sold between Feb. 8 and Oct. 12. The problem stems from a security update for the operating system that Microsoft released last month. The software patch is known as MS08-068.
